

KEEP YOUR EYE ON THE BALL!! This is ALL ABOUT VACCINATIONS!!!!

In the last annual report of risk for vaccination, Health Canada stated "*The AEFI reporting rate was 12.6/100,000 doses distributed (8.1/100,000 population) in Canada for vaccines administered in 2017...*"

<https://www.canada.ca/en/public-health/services/reports-publications/canada-communicable-disease-report-ccdr/monthly-issue/2018-44/issue-12-december-6-2018/article-4-vaccine-safety-in-canada-2017.html>

The average rate of injury for the COVID vaccines (from December 15th, 2020 to February 10th, 2022) is 1 in 3,384 which is shocking. This equates to 30/100,000 doses or 2.4 times the normal rate expected.

For the last two days in Alberta, there were 17 reported AEFI **A DAY**. That is 34 AEFI for 17,979 doses given. 1 in 529 or 0.2% of vaccinated people = 1.4% of AEFI in the last 48 hours!

<https://www.alberta.ca/stats/covid-19-alberta-statistics.htm#vaccinations>

This equals 189/100,000 doses or 15 TIMES the normal rate expected from previous vaccinations.

From December 15th, 2020, to July 1st, 2021, 53% of vaccinations given in Alberta resulted in 26% of reported AEFI's.

From July 1st, 2021 to February 10th, 2022, 47% of vaccinations given in Alberta resulted in 74% of reported AEFI's. This is a significant increase in risk as COVID vaccines have rolled out.

A short while ago, Pfizer submitted their data for approval on a two dose rollout for children six months and up... when all the messaging at the time suggested it would be three doses for these infants.

The FDA approved their two dose application and Pfizer immediately withdrew the now approved application "*due to a lack of data*"... If Pfizer didn't have the data, why did they make an application? And just what did the FDA approve? What did the FDA etc. base the other approvals on?

Just asking for a friend (about 7 BILLION of them).

The reality is three doses were always the next target and if the approval for infants becomes three... then it becomes '**a three for all**' deal. Then Kenney brings back the QR codes, as he has promised.

Despite all of this, we continue.

Now consider that over 65% of all AEFI are normally associated with children two and under. Imagine what these numbers are about to become if this moves forward to those under five. Draw your own conclusions. BUT do your own research. For everyone's sake, especially the children's.
